Hood Installation

First off, what is a "Hood" or "Exhaust Hood"? The basic concept of a hood system is to capture evaporated substances such as: gas, grease, steam, smoke, smell, etc. It essentially filters out some of the contaminants and exhausts all of the evaporated substances into the atmosphere, releasing it from being inside the building and possibly causing a fire hazard and harm to the people that are within. These are required on all projects that have gas equipment and a certain type of hood for simple steam only exhaust (slightly less expensive).

Have you ever considered the complexities of Local Mechanical Code requirements for Exhaust Hoods? City Codes? What if something happens?

Let's see how we can help!

- **We know the codes!!**

Supply drawings showing engineering on air flow, BTU's, Fire systems for Architects and code officials at no cost

- **Balance!!**

Locally air balance the hood with equipment

- **Cost Education!!**

Break out all items on a hood quote showing what is quoted and why. Educating you on what each cost is and why.

- **Value Engineering!!**

Show options to save money over the life of hood like demand control ventilation and variable frequency drive.

- **Experience!!!**

Have a HVAC contractor on staff

- **Inventory!!**

Stock s/s and install for backsplash and anywhere in the kitchen that it is wanted.

- **Tools!!!**

Have metal break and shear in stores to handle issues quickly and efficiently.

Exhaust Hood Types

Let's explore the 4 basic types of hoods. 1. **Low Proximity Hood** is for hoods that will be located in close proximity to the cooking surface. 2. **Wall Canopy Hood** is the most common

type with a wall located at the back side of the hood. 3. **Single Island Hood** is used over cooking equipment where no walls exist. 4. **Sloped Wall Canopy Hood** is for low ceiling heights.
